AI Roast Generator C++

Enter your name:
Name cannot be empty. Please try again.
Enter your name: Divyam

AI Roast Generator says:
Divyam debugs by staring at the screen until the bug feels guilty.

Why this works:

- `name.empty()` returns `true` if the string has no characters.
- The `do-while` loop repeats until the user types something valid.

Even better version (handles spaces too):
If someone enters only spaces like " ", `empty()` won't catch it. Use this instead:

```
do {  
    cout << "Enter your name: ";  
    getline(cin, name);  
  
    // Remove leading/trailing spaces check  
    bool onlySpaces = true;  
  
    for (char ch : name) {  
        if (ch != ' ') {  
            onlySpaces = false;  
            break;  
        }  
    }  
  
    if (onlySpaces) {  
        cout << "Name cannot be empty. Please try again.\n";  
    }  
  
} while (name.empty() || onlySpaces);
```
